1 INTRODUCTION

MTCS-TIAM2 is a high integrated True Color Sensor IC with integrated transimpedance amplifier in a small plastic package on a PCB-carrier. It includes the standard XYZ (RGB) filters based on the known observer function CIE 1931. So the sensor is specialized for fast and absolute, high accuracy color measurement.

The True Color Sensors are made of 19 x 3 photo diodes (special PIN silicon technology with blue-enhanced) integrated on chip. The diodes are carried out as segments of a multiple-element hexagonal matrix structure with the diameter of 2,0 mm.

The design as Si-PIN photo diodes allows signal frequencies up to high-range. In order to achieve a small cross talk between the colored photodiodes the individual sectors were separated from each other by additional structures – separate diode. The photodiodes are sensitized on chip with high-quality and long-time stabile dielectric spectral filters (named True Color Filter¹). These filters correspond to the primary **color standard CIE 1931 (Commission Internationale de l'Eclairage or International Commission on Illumination) and/or the German standard DIN 5033.**

2 APPLICATION

- General Color measurements, checks and regulations
- Portable color reader for consumer and industrial applications
- Closed loop for RGB lighting (SSL) – regulation of temperature shifts
- Sensor for display color adjustment and backlight/contrast control
- Color sensitive sensor for “True Color” reproduction and system calibration
- Detector for various light sources, mood lighting, regulated color temperature

3 FEATURES

- high-resolution conversion of colored light to voltages
- simultaneous measurement of XYZ three colors
- high sensitiveness, transmission, signal frequency
- no ageing of the filter, high temperature stability
- reduced cross talk and linear amplifying
- programmable adjustment of transimpedance
- power down feature
- small in size, lead free
- alike tri-stimulus interference filter for color measurement to DIN 5033 (CIE 1931)
- LCC package (SMD)
- EU RoHS-compliant²

Figure 1: MTCS-TIAM2

¹ The new generation of JENCOLOR sensors is committed to implementing (see relative sensitivity) the standard distribution functions as defined under DIN 5033 Part 2 – Color Measurement; CIE 1931 Standard Colorimetric Systems. This implementation method allows colors to be determined according to the three-range procedure that is defined in part 6 of DIN 5033.

² EU RoHS: Directive 2002/95/EC of the European Parliament and of the Council of 27 January 2003 on the restriction of the use of certain hazardous substances in electrical and electronic equipment.

The integral XYZ color filters on the photodiode array detect the color components of the light falling on the sensor. The photodiodes convert the XYZ light components into photocurrents. Each photocurrent represents X or Y or Z depend on the spectral response shown in the figure below. The integrated transimpedance amplifiers convert the photocurrents to analog voltage outputs. After an offset-correction and calibration these voltages are direct coordinates for the standard CIE1991 / DIN5033 color space. The voltage output of each XYZ channel increases linearly with increasing light intensity.

Please note also the different manner and stages for the transimpedance amplifiers. The amplifier could be switched in process into a higher/lower sensitiveness depend on the light intensity falling on the sensor (see adjustment of transimpedance).

5 SPECTRAL CHARACTERISTIC

Figure 4: Typical (relative) sensitivity (XYZ) of the color sensor^{3, 4} scanned by width broadband light (FWHM 30nm) and limited angle of incidence (<10°)⁵

³ Typical characteristic sensitivity; scanned by monochromatic light with FWHM 27nm, see also chapter 13.2.

⁴ Please note, there are some technical differences between the national or international standards for color measurement based on the tri-stimulus observer function and our realized sensor function. Furthermore each sensor has small production based tolerances of nearly 1% variation referred to the wavelengths. So we recommend calibrating the sensor to achieve best results with a small error in the color space. The calibration depends on different conditions - the sensor, light source, color target, algorithm for calibration and all interferences hit the sensor. In most of cases it's possible to achieve always better results than human eyes. Please ask our technical staff for support if you want to calibrate your sensor system.

⁵ See chapter 13

10 SOLDERING PROFILE

Figure 10: Recommended reflow SOLDERING PROFILE¹⁰

11 HANDLING

Care should be taken to keep the sensor surface clean. Dust, scratches will adversely affect the sensor parameters. Sensors should be handled as an optical device.

It is important to use normal ESD handling and precautions for ESD sensitive devices.

Each series element is baked prior packing for shipment (24hours at 125°C). Devices are packed in a sealed aluminized envelope with humidity indicator card and desiccant. Keep the opening and handling time of moisture bag as short as possible (max. is 72 hours at ≤30°C/60% RH) to avoid baking. If necessary the recommended baking conditions are 24hours at 125°C.

Baking of tape & reel is not applicable (max is <60°C/12hours). For baking at 125°C we recommend to send the components to a Reel Service, they are the experts for de-reeling / baking / re-reeling.

For unsealed packing's the devices must be baked prior soldering. Recommended baking conditions are 24hours at 125°C.

12 PACKING INFORMATION

Standard bag is tape, tube or box. Please ask our sales team for variants and general conditions for manufacturing.

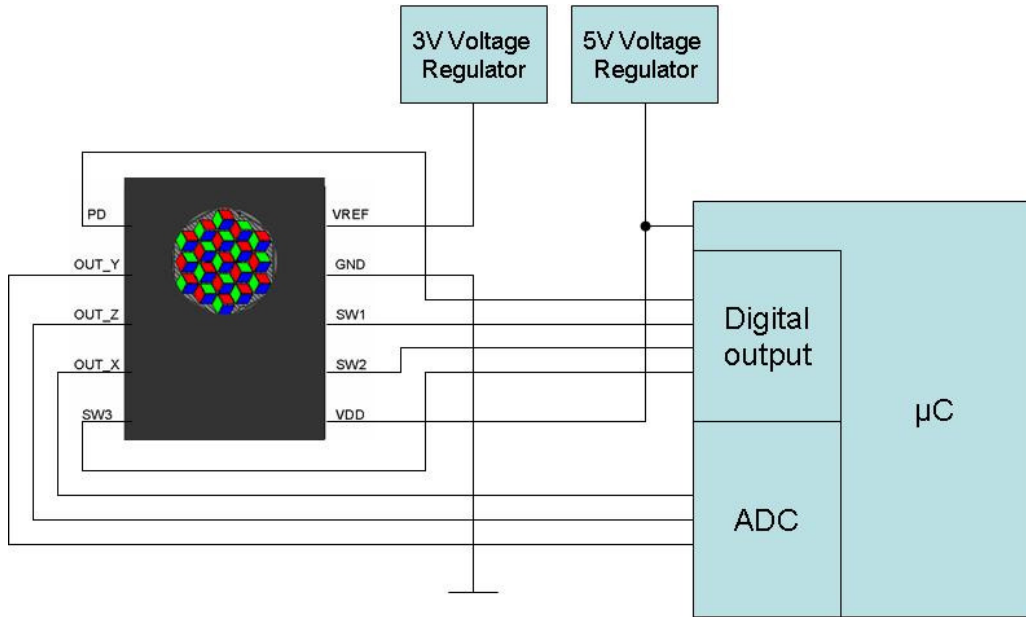

¹⁰ Please note the sensor includes sensitive materials and components. High temperatures and time for soldering more than specified here could damage or destroy the sensor (see also chapter 11).

13 APPLICATION NOTE

Circuit

In the following picture there is an example for connection of MTCS- TIAM 2 to a μ C-based measurement system. Please note the necessary connection of Vref (e.g. 3V, depend on the used ADC) and Vdd (e.g. 5V). Alternatives are possible within the settings (see chapter 7).

The MTCS-TIAM2 includes a multi-channel amplifier of MAZeT. The amplifier can be switched smoothly to the required amplification stage via μ C programming, e.g. if input variables fail to reach or exceed a set threshold. Transimpedance programming is carried out via three inputs and affects all channels simultaneously (see also chapter 0). In the following there is a preposition for an algorithm to switch automatically the required amplification via μ C.

Narrowband luminous sources

The spectral filters of the color sensor ICs are specialized for applications with broad-band source of lighting >10nm. Please ask our sales team before you use our sensor in combination with narrowband luminous sources.

Angle of incidence

In reliance on the packaging the sensor IC has an aperture angle (beam width) of nearly 90°. Traditional an interference filter works depends on angle of incidence. So a bumped light beam with different angles to vertical until 10° will not causes any filter shifts. Make sure by using lenses or optical holes that the angle of incidence for the sensor device will be smaller than 10°.
